

Ultimate II

BY Dr. Alfred F. Libby, MD(H), LHD, Ph.D.

I think is a perfect time to discuss with you the benefits of using Shark Cartilage. I have the feeling this product is being under-utilized and unappreciated by you simply because of lack on understanding about the true and varied benefits of this product. I hope that through this article, I can, in some measure, correct that for you. I have to confess that I have given a great deal of thought to this article and I have actually reworked this at least three times so far. I have come to the conclusion that the topic is so important for you to understand, it is going to require two articles to complete my task for you. But before beginning the discussion, I think it important for you to know that Shark Cartilage is first of all, non-toxic and can, in fact, be used safely, as well as in conjunction with other therapies the individual may currently be taking. This information I'm going to present to you may take a little getting used to on your part because we are going to use some words you are not accustomed to hearing or using in your daily language. But before you can tell others of the multiple benefits from Ultimate II, you must first have a complete understanding of the value of this wondrous product.

Shark Cartilage's main course of action is stimulation of the immune system and inhibition of angiogenesis (the formation of new blood networks). "Angio" refers to blood, and the word "Genesis" as we know it refers to "in the beginning", or the "formation of." Putting these two words together, as used in modern language refers to the formation of new blood vessels during an individual's development or growth, or to the replacement of injured vessels in existing tissue.

ANGIOGENESIS

Let's take a look at this work because it is central to our discussion. In a normal adult, the blood network is well established. Angiogenesis occurs only infrequently; as examples, during ovulation, and pregnancy, in the healing of wounds and fractures, and in certain

heart and/or circulatory conditions. The only other time angiogenesis seems to occur is during the development of a tumor, or other malady associated with the need for a new blood network. Let's follow the logic. Researchers took the position that if angiogenesis could be stopped, tumor growth could be stopped. It was reasoned that without a network of blood vessels to supply it with nutrients and to remove waste materials, a tumor would simply die. Without nourishment, there can be no growth, it's that simple. I think it important to state at the beginning of this discussion that For•Mor International is not advocating ultimate II be used as a treatment for cancer, or as a replacement therapy for any other medically diagnosed condition. Ultimate II is a nutritional food supplement and should be viewed in that context. Having said that, I now want to share with you some scientific studies that state how valuable Ultimate II will be to you as an adjunct to any serious condition that affects your body. According to an article published by Patricia D'Armour, M.D., "The only event that stands between maintenance of metastatic cells in a dormant state and their establishment into a secondary tumor is the development of a vasculature. In other words, find a substance that will effectively prevent the development of new blood vessels that will support new tumor development. For the sake of clarity, let's define a couple of terms: (Metastatic): The development of a new cancer growth spreading from an original site to a brand new site. Spread to a new site is by the bloodstream or lymphatic system, (Dormant); Marked by a suspension of activity, (Vasculature): A system of blood vessels. I hope this brief explanation helps to make this reading not so tough.

D'Amore expressed the belief that vascularization is "clearly essential for the establishment and subsequent growth of metastases." She also believed that inhibition of angiogenesis may be a way of preventing metastasis. This concept expressed by Dr. D'Amore would be conclusively proven in a

study reported in the New England Journal of Medicine on January 3, 1991, by a research team who also concluded that without vascularization, there is little metastasis. This evidence is particularly important in cases of breast cancer because, breast cancer begins to metastasize when the tumors are quite small. Even early detection procedures may be too late to prevent metastasis, the real killer. Such evidence means that Shark Cartilage's potential of halting vascularization and therefore stopping metastasis may be truly vital in the prevention of breast cancer. What is significant about this product is that Shark Cartilage apparently contains at least three separate proteins that possess powerful substances which prevents the body from forming new blood vessels that would otherwise supply nutrition to tumors (anti-angiogenesis factors). There are complex carbohydrates contained in the Shark Cartilage known as muco-poly-saccharides which apparently give cartilage other therapeutic benefits besides angiogenesis inhibition. It is the mucopolysaccharides that have the immunoregulatory effect, and they also have an anti-inflammatory effect. Notice in the Ultimate II formula, there is a large percentage of mucopolysaccharides in the product for your benefit.

I do want to leave you with a few thoughts for you to ponder.

1. Tumors and metastases cannot develop without a network of blood vessels.
2. Tumor growth is dependent upon the growth of new blood vessels.
3. Few, if any, sharks get cancer.
4. Cartilage has no blood vessels.
5. Shark's skeletons are composed primarily of cartilage.
6. Shark Cartilage is the most effective non-toxic substance for prohibiting angiogenesis. The anti-genesis effect, it is quite clear, is shark Cartilage's main weapon, a weapon that works synergistically (enhances the effectiveness) with the mucopolysaccharides.

The more you know, the better equipped you're going to be.
